

# Package ‘timeless’

July 2, 2024

**Title** Fast General Purpose Date/Time Converter

**Version** 0.2.2

**Description** Fast general purpose date/time converter using 'Rust'. The package implements date time, date and epoch time parser for heterogeneous vectors of dates.

**URL** <https://github.com/schochastics/timeless>,  
<https://schochastics.github.io/timeless/>

**BugReports** <https://github.com/schochastics/timeless/issues>

**License** MIT + file LICENSE

**Encoding** UTF-8

**RoxygenNote** 7.3.0

**Config/rextendr/version** 0.3.1

**Depends** R (>= 3.6)

**LazyData** true

**Suggests** testthat (>= 3.0.0)

**Config/testthat/edition** 3

**NeedsCompilation** yes

---

bench_date	<i>A benchmark dataset with different date formats</i>
------------	--

---

**Description**

A benchmark dataset with different date formats

**Usage**

bench\_date

**Format**

An object of class character of length 93.

---

chronos	<i>Fast general purpose parser for date(time) from input data</i>
---------	---

---

**Description**

Fast general purpose parser for date(time) from input data

**Usage**

```
chronos(x, formats = NULL, tz = "", to_tz = "", out_format = "datetime")
```

**Arguments**

x	A vector with date(time) expressions to be parsed and converted.
formats	character vector of formats to try out (see <a href="#">base::strptime</a> ). If NULL, uses a set of predefined formats mostly taken from the anytime package.
tz	assumed input timezone. If "", uses local timezone. See details
to_tz	convert datetime to timezone given in to_tz. If "", tz is used. See details
out_format	character. Defining the format of the returned result. Can be "datetime", "date", or "character".

**Details**

The internal parsing is done "timezoneless". The timezone given in tz is just added to the datetime without any conversion. If to\_tz is given, a conversion is made from tz to to\_tz.

**Value**

A character vector which can be transformed to POSIXct or date

**See Also**

[parse\\_datetime](#), [parse\\_date](#), and [parse\\_epoch](#) if you need more control over formatting

**Examples**

```
chronos(bench_date)
```

---

parse_date	<i>Parse date from strings using different formats</i>
------------	--

---

**Description**

Parse date from strings using different formats

**Usage**

```
parse_date(x, formats = NULL, out_date = "%Y-%m-%d")
```

**Arguments**

x	A vector with date(time) expressions to be parsed and converted.
formats	character vector of formats to try out (see <a href="#">base::strptime</a> ). If NULL, uses a set of predefined formats mostly taken from the anytime package.
out_date	character defining the date format of the parsed strings

**Value**

character vector of parsed dates.

---

parse_datetime	<i>Parse datetime from strings using different formats</i>
----------------	--

---

**Description**

Parse datetime from strings using different formats

**Usage**

```
parse_datetime(x, formats = NULL, out_datetime = "%Y-%m-%d %H:%M:%S")
```

**Arguments**

x	A vector with date(time) expressions to be parsed and converted.
formats	character vector of formats to try out (see <a href="#">base::strptime</a> ). If NULL, uses a set of predefined formats mostly taken from the anytime package.
out_datetime	character defining the datetime format of the parsed strings

**Value**

character vector of parsed datetimes

---

parse_epoch	<i>Parse datetime from epoch</i>
-------------	----------------------------------

---

**Description**

Parse datetime from epoch

**Usage**

```
parse_epoch(x, tz = "", out_datetime = "%Y-%m-%d %H:%M:%S")
```

**Arguments**

x	A vector with date(time) expressions to be parsed and converted.
tz	timezone of output datetime. If "", uses local timezone
out_datetime	character defining the datetime format of the parsed strings

**Value**

character vector of parsed dates.
